  Notes:
    - Available in 96% Power Efficiency.
    - 200-240VAC power input only.

HPE Flexible Slot (Flex Slot) Power Supplies share a common electrical and physical design that allows for hot plug, tool-less installation into HPE ProLiant Gen11 Performance Servers. Flex Slot power supplies are certified for high-efficiency operation and offer multiple power output options, allowing users to "right-size" a power supply for specific server configurations. This flexibility helps to reduce power waste, lower overall energy costs, and avoid "trapped" power capacity in the data center.

All pre-configured servers ship with a standard 6-foot IEC C-13/C-14 jumper cord (A0K02A). This jumper cord is also included with each standard AC power supply option kit. If a different power cord is required, please check the ProLiant Power Cables web page.

To review the power requirements for your selected system, please use the HPE Power Advisor Tool.

Notes: European Union ErP Lot 9 2024 Regulation

Beginning on January 1st, 2024, units sold into the European Union (EU), European Economic Area (EEA), the United Kingdom, Ireland, Switzerland or Turkey, must include more efficient AC power supplies: 94% for multi-output and 96% for single-output. HPE Flexible Slot power supplies are single-output, and part numbers 865438-B21, P03178-B21, and P44712-B21 are 96% efficient, thus meeting requirements. HPE is on target to fulfill compliant systems ahead of time and will begin enforcing these requirements in advance to satisfy requests with the current power supplies by the set deadline.

Configuration Information

Smart Templates from HPE

HPE is releasing new Smart Template technology in the One Config Advanced (OCA) configurator. These Templates represent the CTO equivalents of the top-selling BTO configurations. They are intended to provide simple starting points to assist you in easily creating and customizing your desired Server solutions. HPE Servers that have Platform Templates, developed by HPE Product Managers, will have a separate tab in the HPE OCA configurator.

Workload Solutions Templates from HPE

The Workload Solutions Templates are built on the Smart Templates technology to easily develop working configurations of the most compelling Workload Solutions. The templates complement the Reference Builds developed by HPE. Workload Solutions templates preconfigure some of the key architecture decisions and make it easier for Sellers to get started and complete a differentiated server solution for your customer's specific workload.

Mainstream SKUs

HPE launched the Mainstream SKU initiative as a market-driven approach to Demand Steering. It is a simplified portfolio of our top selling options that meet the current and future market trends. HPE has committed to providing a more predictable and faster experience for these options. Mainstream SKUs enjoy higher safety stock levels and have higher fulfilment service levels than non-Mainstream SKUs. Mainstream orders are fulfilled +30% faster than non-Mainstream orders, have fewer shortages and better recovery dates. This platform has Mainstream SKUs in the options portfolio, and is eligible for the improved Mainstream experience. Mainstream SKUs are designated with a Mainstream symbol in our configurators.

Mainstream Configurations

HPE is using the new Smart Templates technology to present Mainstream configurations. All the options in a Mainstream configuration are pre-selected Mainstream SKUs to optimize the performance, predictability and fulfillment experience. Check the Template section in our configurators for eligible Mainstream configurations.

This section lists some of the steps required to configure a Factory Integrated Model. To ensure only valid configurations are ordered, Hewlett Packard Enterprise recommends the use of an HPE approved configurator. Contact your local sales representative for information on configurable product offerings and requirements.
- – Factory Integrated Models must start with a CTO Server.
- – FIO indicates that this option is only available as a factory integrable option.
- – All Factory Integrated Models will be populated with sufficient hard drive blanks based on the number of initial hard drives ordered with the server.
- – Some options may not be integrated at the factory. Contact your local sales representative for additional information.
- – Beginning on January 1st, 2024, units sold into the European Union (EU), European Economic Area (EEA), the United Kingdom, Ireland, Switzerland or Turkey, must include more efficient AC power supplies: 94% for multi-output and 96% for single-output. HPE Flexible Slot power supplies are single-output, and part numbers 865438-B21, P03178-B21, and P44712-B21 are 96% efficient, thus meeting requirements. HPE is on target to fulfill compliant systems ahead of time and will begin enforcing these requirements in advance to satisfy requests with the current power supplies by the set deadline.
- – All CTO servers are ENERGY STAR® 3.0 compliant. After January 11, 2024, ENERGY STAR® 3.0 compliance is no longer valid. ENERGY STAR® 4.0 certification will be valid upon system configuration.

Step 2b: Choose Memory Options
Please select one or more memory from below.
For new Gen11 memory population rule whitepaper and optimal memory performance guidelines, please go to:
https://www.hpe.com/docs/memory-population-rules
For Gen11 memory speed table, please go to: https://www.hpe.com/docs/memory-speed-table
For memory Reliability, Accessibility, Serviceability (RAS) features whitepaper like Fast Fault Tolerance and legacy
mirrored memory feature etc. please go to: https://www.hpe.com/psnow/doc/a50007802enw
Notes:
– The maximum memory speed and capacity is a function of the memory type, memory configuration, and
   processor model.
– Quantity of memory DIMMs selected per socket must be 1, 2, 4, 6, 8, 12 or 16.
– For additional information, refer to the HPE DDR5 Smart Memory QuickSpecs.
– For General Server Memory and Persistent Memory Population Rules and Guidelines, see details here:
   http://www.hpe.com/docs/memory-population-rules
– HPE Server Memory compatibility for a specific server platform may vary or be limited within a server platform
   depending upon the specific configuration being requested. Because each server environment and
   requirements can vary, memory compatibility is based not only upon the server family but may also be
   affected by the amount and type of additional hardware options installed within a specific server configuration.
   For this reason, some HPE memory DIMMs may be qualified for an HPE server model or family and yet
   occasionally not be supported with some configurations within that server family.
– The new 5600 DIMMs are for the Fifth generation Intel® Xeon® Scalable Processors, while the 4800 DIMMs are
   for the Fourth generation Intel® Xeon® Scalable Processors.

- 256 GB memory is limited to 25°C maximum inlet temperature with non-Redundant Fan configuration. 30°C maximum inlet temperature can be supported with Redundant Fan configuration.

HPE Networking

Notes:
- Maximum of two OCP adapters are supported, the Networking OCP3 adapter uses Slot 15 (OCP 2 slot) by default.
- WOL and shared NIC function are only supported in Slot 15 OCP 2 slot.
- OCP2 Enablement Kit is required when installing OCP card in Slot 15 OCP 2 slot.
- Slot 14 OCP1 slot provides x8 PCIe 5.0 lanes from system board, additional OCP1 Enablement Kit for x16 OCP NIC to install on Slot 14 OCP1 is not required with following adapters unless otherwise notice.
- High performance networking card is equaled or greater than 100Gb that may cause the fans to operate at higher speed and higher acoustic level to maintain optimum system cooling when system at idle status.
- Direct Attach Cable (DAC) for copper environments or fiber transceivers and cables for fiber-optic environments must be purchased separately. Refer to the related NIC QuickSpecs for Technical Specifications and additional information: https://h20195.www2.hpe.com/v2/getpdf.aspx/A00002507ENW.

HPE Power Supplies

HPE Flexible Slot (Flex Slot) Power Supplies share a common electrical and physical design that allows for hot plug, tool-less installation into HPE ProLiant Servers. Flex Slot power supplies are certified for high-efficiency operation and offer multiple power output options, allowing users to "right-size" a power supply for specific server configurations. This flexibility helps to reduce power.

waste, lower overall energy costs, and avoid "trapped" power capacity in the data center.

Notes:

– Prior to making a power supply selection it is highly recommended that the HPE Power Advisor Tool is run to determine the right size power supply for your server configuration.

– Visit HPE Power Cords and Cables for a full list of optional power cords.

– Flex Slot Platinum power supplies support power efficiency of up to 94% and include a standard C-14 power inlet connector.

– Flex Slot Titanium power supplies support power efficiency of up to 96% and include a standard C-14 power inlet connector.

General Memory Population Rules and Guidelines:

- Install DIMMs only if the corresponding processor is installed. If only one processor is installed in a 2-processor system, only half of the DIMM slots are available to populate.
- If a memory channel consists of more than one DIMM slot, the white DIMM slot is located furthest from the CPU. White DIMM slots denote the first slot to be populated in a channel. For one DIMM per channel (DPC), populate white DIMM slots only.
- Rank mixing is not allowed on a channel except for 1 rank + 2 rank combination when all 16 DIMMs for a Processor socket is populated. (2 rank in white slot, 1 rank in block slot),
- No x4 mixing with x8 across a socket.
- If multiple CPUs are populated, split the HPE Smart Memory DIMMs evenly across the CPUs and follow the corresponding CPU rules when populating DIMMs.

Memory

- – To maximize performance, it is recommended to balance the total memory capacity across all installed processors and load the channels similarly whenever possible.
- – If the number of DIMMs does not spread evenly across the CPUs, populate as close to evenly as possible.
- – Avoid creating an unbalanced configuration for any CPU.
- – The maximum memory capacity is a function of the number of DIMM slots on the platform—the largest DIMM capacity qualified on the platform and the number and model of qualified processors installed on the platform.
- – Do not mix HPE Smart Memory RDIMMs and HPE Smart Memory LRDIMMs in the same system.
- – The 256 GB 8R 3DS RDIMM can be mixed with 128 GB 4R 3DS RDIMM ONLY in 16 DIMMs populated. 256 GB 8R 3DS RDIMM needs to be in white slot while 128 GB 4R 3DS RDIMM needs to be in black slot.
- – The maximum memory speed is a function of the memory type, memory configuration, and processor model.
- – DIMMs of different speeds may be mixed in any order; however, the server will select the lowest common speed among all of the DIMMs on all of the CPUs.
- – HPE Smart Memory DIMMs and HPE NVDIMM-Ns from previous generation servers are not compatible with the current generation. Certain HPE Smart Memory features such as memory authentication and enhanced performance may not be supported.
- – There are no performance implications for mixing sets of different capacity DIMMs at the same operating speed. For example, latency and throughput will not be negatively impacted by installing an equal number of 32 GB 1rank x4 DDR5-4800 DIMMs (in block slot) and 64 GB 2rank x4 DDR5-4800 DIMMs (in white slot).
- – Take each DIMM type and create a configuration as if it were a homogeneous configuration.
- – For details on the HPE Server Memory Options Population Rules, visit:
  http://www.hpe.com/docs/memory-population-rules.
- – For additional information, refer to the HPE DDR5 Smart Memory QuickSpecs.

Notes: The maximum memory speed is a function of the memory type, memory configuration, and processor model.

To view the regulatory information for your product, view the Safety and Compliance Information for Server, Storage, Power, Networking, and Rack Products, available at the Hewlett Packard Enterprise Support Center: https://support.hpe.com/hpesc/public/docDisplay?docLocale=en_US&docId=c03471072

Environmentally friendly Products and Approach End-of-life Management and Recycling

Hewlett Packard Enterprise offers end-of-life product return, trade-in, and recycling programs, in many geographic areas, for our products. Products returned to Hewlett Packard Enterprise will be recycled, recovered or disposed of in a responsible manner.

The EU WEEE directive (2002/95/EC) requires manufacturers to provide treatment information for each product type for use by treatment facilities. This information (product disassembly instructions) is posted on the Hewlett Packard Enterprise web site. These instructions may be used by recyclers and other WEEE treatment facilities as well as Hewlett Packard Enterprise OEM customers who integrate and re-sell Hewlett Packard Enterprise equipment.

Acoustic Noise

Listed are the declared mean A-Weighted sound power levels (LwAm), declared average bystander position A-Weighted sound pressure levels (LpAm) and the statistical adder for verification, Kv, is a quantity to be added to the declared mean A-weighted sound power
level, LwA,m when the product is operating in a 23°C ambient environment. Noise emissions were measured in accordance with ISO 7779 (ECMA 74) and declared in accordance with ISO 9296 (ECMA 109). The listed sound levels apply to standard shipping configurations. Additional options may result in increased sound levels. Please have your HPE representative provide information from the HPE EMESC website for further technical details regarding the configurations listed below.

Test Case	Base LFF	Base SFF	Perf SFF 1	Perf SFF 2	Perf SFF 3
Idle					
LwA,m	4.0 B	3.9 B	4.0 B	4.0 B	4.1 B
LpAm	26 dBA	25 dBA	25 dBA	25 dBA	25 dBA
Kv	0.4 B	0.4 B	0.4 B	0.4 B	0.4 B

LwA,m	4.1 B	4.1 B	4.1 B	4.2 B	4.2 B
LpAm	26 dBA	26 dBA	26 dBA	26 dBA	26 dBA
Kv	0.4 B	0.4 B	0.4 B	0.4 B	0.4 B

Notes:

– The declared mean A-weighted sound power level, LWA,m, is computed as the arithmetic average of the measured.
– A-weighted sound power levels for a randomly selected sample, rounded to the nearest 0,1 B.
– The declared mean A-weighted emission sound pressure level, LpA,m, is computed as the arithmetic average of the measured A-weighted emission sound pressure levels at the bystander positions for a randomly selected sample, rounded to the nearest 1 dB.
– The statistical adder for verification, Kv, is a quantity to be added to the declared mean A-weighted sound power level, LWA,m, such that there will be a 95 % probability of acceptance, when using the verification procedures of ISO 9296, if no more than 6,5 % of the batch of new equipment, has A-weighted sound power levels greater than (LWA,m + Kv).
– The quantity, LWA,c (formerly called LwA,m), can be computed from the sum of LWA,m and Kv.
– All measurements made to conform to ISO 7779 / ECMA-74 and declared to conform to ISO 9296 / ECMA-109.
– B, dB, abbreviations for bels and decibels, respectively, where 1 B = 10 dB.
– The results in this declaration apply only to the model numbers listed above when operating and tested according to the indicated modes and standards. A system with additional configuration components or increased operating functionality may increase the noise emission values.
